BATTLE RAGES OVER FUTURE MICROS

TWO of the world's major software houses are locked in battle over future computers.

Both want to sign as many more makers as possible to use their new standards — which could lead to software which will work on several computers as well as more programming features.

The two companies are Microsoft, with its MSX standard, and Digital Research, which has a combination of its CP/M operating system — used mostly for business micros — and BASIC.

Already Microsoft says it has broad agreements from 14 Japanese micro makers and the first MSX adaptor would be available for Spectrabase computers by the end of the year with an MSX computer by early next year.

And more MSX computers are expected to follow shortly after words from Japanese companies.

As well as promising software compatibility, the MSX standard includes colour graphics and sound and even the positions of the ports.

It is based on the popular Z80A processor.

Digital Research, which has recently opened an office in Japan, already has CP/M, by far the most popular operating system for business micros, MIBASIC and the newly-launched Personal BASIC.

Now it is marketing its rights for CP/M operating systems to home computer makers.

How will the home micro user benefit? David Press, UK head of Microsoft, said: "They wouldn't use it — but how they would benefit is they would get more compatibility and standard based software."

He said 14 Japanese companies had agreed to accept Microsoft's BASIC, with the backing of the Japanese government.

And, in a comment which

highlights the rivalry, he said: "Digital Research are just not popular in Japan — they have got no credible slice of the market there."

"I think we will become predominant, and that's MSX with the weight of the Japanese industry behind it. I would not like to say and stop it."

Digital Research sees it differently, of course. Its director of European operations, Paul Bailey, believes there may mean-

fully be up to five compatible systems, including the Digital Research version.

He said: "It's a competitive market. But the biggest competition is from homegrown operating systems which has caused a lot of fragmentation." Digital Research was determined to be competitive throughout the whole range of computers from large ill-based business

systems to imaginative home models.

Its standard could even offer built-in "import systems" like home layout and home décor as well as improved graphics and better facilities for spreadsheets and databases.

Mr Bailey, who founded his company, would have finished his development work in six months, said "It's going to be a lot more exciting. You will be able to get a lot more done."

However, Gail Wellington, Commodore's UK software manager, saw a limited desktop tool — in standardising on one system development would be better.

She believed it would be most useful for business computers where the demand was for more memory and speed, rather than colour, sound and special effects.

She thought a standard could be offered to home users as a plug-in option, or built-in and switchable.

Tandy's customer services manager, Graham Richardson, said: "I'd like to see it happen. As that present time there is no confusion in the minds of the users."

"But would a buyer come back next week and buy his software from you, or will he go to the shop down the road? It can only do as good — we have never been particularly disturbed about other people selling software for our computers."

"And there would be an obvious advantage for software dealers to sell their programs to more people without having to convert."

Lots of storage for CBM micros

For VIC-20 and Commodore 64 owners who want a local storage, Accesscom and Power Systems has brought out a dual floppy disk unit which takes 3-inch floppy disks. The disk unit (216) is single density and 250K is double density format.

The only drawback is that at £180, the unit costs quite a bit more than the computers.

Accesscom & Power Systems, 6-11 Foxdown Grove, Farnborough, Hampshire

LATE NEWS

More group talks Minister. Act now

A final strong delegation from the Computer Trade Association met Trade Under Secretary John Buzcher.

They discussed software piracy, education and the "unfair" import levy — no per cent on computers but 13 per cent on components — which makes it cheaper to manufacture abroad.

After the meeting CTA general secretary Nigel Beck said: "We felt that we and the minister were talking along the same lines. The main problem is that the Government did not realise the urgency, that action has to be taken quickly."

The CTA is making legal advice cost 100K which can be capitalised to lower, and believes there is a possibility of persuading the Director of Public Prosecutions to take criminal action for conspiracy.

GEC buys most of Torch

GEC, the giant industrial group, has bought a 76 per cent stake in Torch Computers from three company shareholders.

Chairman Morris Vrijland, Deputy and managing director Peter Harris who founded Torch two years ago, retain their 24 per cent holding.

A Torch spokesman said

the "large sum of money" was needed for research, development and marketing, and that GEC believed it was a good opportunity to buy into a high technology company.

The lowest priced Torch is £2 765 with 16K of RAM, and the company has just launched the Super Torch and 800 Series work station. Each Torch incorporates a board from Acorn which is also used in the BBC micro.

Fighting dragons is all of a day's work for the men from Linnich.

Mail order with a human face

Crash Micro Games, a new software-by-mail company recently set up in Luton, wants to set an end to Games mail order.

According to Roger Koon, one of the three partners in Crash, "computer games represent a major new entertainment, but producers and distributors aren't treating it with the sort of devotion you find in the pop music industry." Yet in many ways the two are very similar.

"Games playing is enjoyable,

but the choosing and purchasing of games should be just as much fun. Our customers should know who they are talking to and buying from."

Crash designs its own ads, which are intended to have the human rather than hi-tech touch, as well as its catalogue, which it describes as "an eight-page magazine".

Currently the company sells over 30 titles by post, all for the fourpound. But it will be expanding into 2,500, 5000 and 10,000 software titles.

Sarah Mrs. Harrison, for a copy of the catalogue, you get the 50p back with your first order. Crash Micro Games Archive, Luton, Bucks LU1 1JL

From data to music — and back

Sony is the latest manufacturer to bring out a cassette recorder aimed specifically at home computer users.

It's a useful feature of the DR 100 lets you change from data

to music made at the flick of a switch. A third data mode allows you to hear the data as it's being loaded or recorded.

Other features are recording level indicator and tape counter with read. The recorder will run off mains or battery, and sells for around £40.

Sony, 8 Drayton Road, Green Lane Estate, Watford, Herts WD18 2QU

US software firm acts on rentals

A lawsuit currently in progress in the US over software rentals could have international repercussions on the software industry in this country.

MicroPro, which makes business microcomputer software and produced the WordStar word processing program, has taken software rental company United Computer Corporation to court, claiming copyright infringement.

MicroPro wants UCC to pay damages of \$10 million, and the court company principal to pay \$4 million costs.

The company "alleges" rather than sets its software to customers, on condition that the programs are not lent out or copied.

Last autumn MicroPro and Digital Research were jointly awarded \$250,000 in a suit charging DataKor International with illegal software copies.

MicroPro's General Counsel

Eric Gardner expects the current case to encourage other US software companies to start proceedings against rental companies.

And David Batcher, director of MicroPro's UK Division, warned that similar action might be taken against rental companies in this country.

Programs that mean business

Sharp has launched a range of business software for its M2, M3A, M3C.

There are six programs in the range: Inventory, Price List, Sales Ledger, Purchase Ledger, Inventory and Stock Control. They cost £19.95 each, including a user manual.

Each program can be used separately, but Sharp has been designed to work as a complete system too.

Sharp, Sharp House, Throp Road, Manchester M13 9BB

You could be on our pages

We welcome program articles and tips from our readers.

PROGRAMS should, if possible, be computer printed to a width of 48 characters (use a new ribbon) and/or sent on cassette. Check carefully that they are bug-free, include details of what your program does, how it works, variables you have used and hints on conversion.

ARTICLES on using home computers should be no longer than 1,000 words. Don't worry about your writing ability — just try to keep to the style in MCW. Articles most likely to be published will help our readers make better use of their micros by giving useful ideas, possibly with programming examples, we will convert any scratch illustrations into finished artwork.

TIPS are short articles, and brief programming routines which we can put together with others. Your hints can aid other computer users.

Competitive rates are paid.

Keep a copy of your submissions and include an SAE if you want them returned. Label everything clearly and give a daytime and home phone number if you can.

Paul Upcott, Home Computing Weekly, 148 Charing Cross Road, London WC2H 9BS

WINDOW ON ANOTHER WORLD

NEW RELEASES FOR DRAGON 32 FROM

Salamander Software

THE DRAGON'S TOWER

£6.95

Embark on a fantastic adventure for one player. Can you, as Dan Desmond, solve the riddle of the dragon, or will you fall prey to its mystery as so many other before you? Breakdown's Tower opens complete with a 32-page fully illustrated user file.

THE BATTLE

£7.95

Headed for the border between Titan and Nival, the highest mountain in the world. Givers, Goddess Mother of the world, powers fire and a half sister above you level. In 1000, the Elderated Elderly, and Strong Talking Mercury were the first men to conquer the unquenchable. Now you have the chance to solve the riddles of Eternity, Liberty or Nival. Will you succeed and as a legend, or will your name live forever in the annals of ancient mountain history?

CRASHING POWER

£7.95

By the year 1100 the Earth is a barren and desolate wasteland. With all signs of humans and life, the human race had begun to die. With a bright, bright, bright power, nature began to return. Now the CRASH has been released for a liquid first draft from England's finest and most powerful, and most successful shop, the Crashers, was developed. Your mission was to crash and save the Earth's Civilization in an arcade game requiring 1 picture.

Times are a-changing for software

The software industry is fast approaching maturity. A change is taking place from an amateur backroom industry to a professional big business. This is evidenced by the arrival of Virgin Games and Ultimate on the scene.

The change can only be good for the consumer. Quality, especially in games, is rising sharply, caused by increasing competition and more critical reviews in magazines. It will be hard to beat the quality of games like Ultimate's Jet Set for the Spectrum.

□ □ □ □

All this has meant greater pressure on programmers to be constantly improving their products. A (usually) professional attitude now has to be taken with each new game.

More and more frequently, teams of people are involved in producing a program. Artists to design the graphics, specialists on technical or sound effects, and often others - each an expert.

Programmers not only need to know how to write code, but must be paid adequately too. They must have a talent for drawing, a reasonable understanding of music and sound effects, and greater than average knowledge of hardware.

A lot of software houses are now moving over from freelance programmers in full-time, salaried programmes, who can make the most of time and expertise without carrying up a huge phone bill. The days of the solitary programmer who cares more than his father for the interest of the public just won't survive another day more.

□ □ □ □

Over the next few years, I foresee the software houses becoming the richest and best of the professions (the exception of pop stars). There's a tried and tested technique which has worked for films and records, and will work again.

On the subject of marketing, it more honest to trade to advertising as found to develop more because of the dissatisfaction with companies who spend more on top-up advertising than they do developing their programs. No-one wants to pay £3 or £5 for a single cassette insert covering a game which is a mere updating for what was advertised.

□ □ □ □

There has been a lot of discussion at HCF's conference on the subject of software piracy. I don't think the general public appreciates the cost of producing a software product. No-one can predict whether a game will be a roaring success or a priced flop, and you're not paid for your journey against shipping loss.

Not until bootleggers start appearing among the amateurs who only put people off buying further software will there start to drop in a more reasonable £5-£6 or £8 - but they'll never go as low as £1.50.

As one who knows the software business from the inside, I'd say that the public should be careful when spending their money, and always look at a selection of programs before buying. If you think a program's too expensive, don't buy it. Sales on the back of them are the only thing that will guarantee a better situation for both consumer and software company.

□ □ □ □

David J. Anderson

Spectrum programmer for Silverdust and Herd, Wakefield, Yorkshire

Software writers — it's your agent

If you've written a program you think might make the big time, you may be interested to hear that Neil Gibson & Co will act as an agent for software writers.

John Cheung, a marketing consultant who set up the venture, explained: "In publishers or music, writers take their work to agents who negotiate the best deals for them. Software is the only industry I know of where this doesn't happen as a matter of course. Writers have to try and find for themselves."

He first got interested in the software market after hearing about an offer a software company had made to two of his son's friends. He said: "I was frankly appalled at the terms of the offer."

"I advised them to have nothing to do with it, and we let three weeks pass and we got them an offer at four times the previous amount, and we might more straightforward terms."

Mr Cheung set up his venture six months ago, after researching the market for a year. As part of his research, he says, he looked at all the commercially available software for the home market.

"My accounts and I now have cupboards full of cassettes," he said. "It hasn't gone down very well with our wives."

Like any other kind of agent, Neil Gibson doesn't ask programmers for any money until they've actually been paid for a program. Programs that are not in his considered acceptable are simply returned.

If the company thinks a program does have potential, it will advise writers a deal is imminent and, in some cases, provide a

complete marketing service, including packaging and a sales representative.

To secure programs, Neil Gibson uses the services of a paid-out panel, who play the games and say what they like and dislike about them.

In the six months the venture has been underway, Mr Gibson says they have been sent about 200 programs, of which half have had to be rejected. A quarter are being improved, and a quarter have been placed with software companies.

If it succeeds in selling a program to a company, Neil Gibson takes from one to 25 per cent of the proceeds, depending on how much work has gone into the deal.

"But we have to accept the same terms as the programmer", Mr Cheung said. "If they've paid a percentage of sales, then we have to wait for that percentage."

"In some cases a programmer will be better off than he'd be, and we're bound by the terms of our contract to stick the best possible deal for the programmer."

"And if by any chance we spend more on promoting a program than we get back, we don't ask the programmer to make the loss good."

Mr Cheung said he expected the venture to start making a profit in two years' time. "We believe it's a market with a good long-term future, and we're prepared to wait."

Neil Gibson & Co, 47 Adelaide Street, Rye, St Edmunds, Suffolk.

PIRATE

is a new adventure game for young people. YOU are a pirate and as a young boy to explore an uncharted world. Simple freedom City games like exploring, research, events may follow around the New World. There are also your personal quest for the sea captain. One of the things you can get your hands on will be a new title: a game like of Van Helsing and several programs for £12.50 full featured.

Details of these and more has placed them

Trade and Export enquiries welcome.

Going for the record

Anco Software is hoping to push down the price of programs — by releasing them on 7-in records instead of cassettes.

Anco's president Philip Smith said, "I heard that someone had released a music single with a program on the back and thought, why don't I give it a try?"

"I rang round a few record producers to get estimates and found a company that's given us a really good deal — it's giving us not half of the price of producing a cassette."

Mr Smith came to appeal mainstreaming computer games: players buying software out of their pocket money "At present", he said, "the only way for them to buy games is to use for a few weeks, or bring one of their parents to buy for them."

The first programs Anco is releasing on record are for the Spectrum. There is a Huginn pack and a new game, Sam Slay, which will both run on the 16K machine, and a 48K version of Defender. Each game will cost £2.25 net postage and packing.

The games can be loaded directly from a record player into the Spectrum via the headphones socket, but Anco recommends that a cassette backup copy is made in case the record gets scratched.

Philip Smith wants to drop the price of the software records still further if the deal catches on. Meanwhile, he will be continuing to supply Anco software on cassettes.

Anco Software, 25 Cornwell Street, Cheadle

Win a prize with your Spectrum

If you're a Spectrum owner living in the Portsmouth area, come into Radio Victory this Saturday for a competition designed with your money in mind.

The competition is in the form of a program written for Radio Victory by Portsmouth-based software company Automata.

Load the program onto your Spectrum — either direct from the radio or from a tape recording — run it, and you'll find a couple of lines that might seem familiar.

If you think you know where they come from, write in to Radio Victory's DJ Dave Carson, and

you could be among the lucky prize winners.

The idea for the competition came from Radio Victory, but Automata is no stranger to radio. As well as software, the company specialises in "all-round entertainment", according to director Charles Proffitt.

It has worked with Radio Victory before, producing a 20-week quiz series which Christmas was "under the University Challenge without the brain".

The Spectrum competition will be broadcast every Saturday for the next three weeks between 1 and 2 pm. As well as Portsmouth, studios in Southampton, Petersfield, Arundel, Solihull, the Isle of Wight and Canford should be able to hear the broadcast.

From books to software

Another sign of the shake-up of things to come in the software market: paperback book

distributors Woburn Group has announced that it's moving into software.

The arrival of large companies like Woburn, which come on to the software scene ready armed with experienced marketing and promotional in other fields, is just part of the steadily growing realisation of home computer software.

Clive Digby-Jones, who is in charge of the Woburn Software operation, said "We'll be selling into retailers, who won't by any means be just computer shops, on the basis of service and marketing support."

"Technical" having to deal with dozens of different suppliers, the retailer will be able to obtain all the worthwhile titles for only 12

different computers from just one source."

Woburn plans to run off 700,000 programs, mostly games but also some educational and small business software. The list is expected to quickly double in size as new titles come out — but Woburn says it will select titles first to make sure they are good quality.

Marketing manager Jerry Trist said: "We want Woburn Software to be associated with titles that work and are good value for money."

"Any retailer who deals with us is not just buying an assortment of software, but also the package including product evaluation, testing and marketing support."

Woburn Software, Langham Park, Cornwell Lane, Cheadle, Surrey GU21 1NG

Prize-winner Francis Ho (left) and Audiogonic's Susan Allan and David Smith

Francis gets our top prize

Francis Ho got the top treatment when he came to our office last week.

He was first prize winner as a competitor in the ninth issue of *Home Computing Weekly*.

And the presentation was made in the laboratory by David Smith, product manager of the sponsors of the competition, Audiogonic.

In the competition readers were asked to find Audiogonic software titles — among a list provided — hidden in a word square.

Francis, a music classmate account, aged 22, found them all. His choice of the £1,000-worth of prizes was Audiogonic's *Wordprint 39 word processor* cartridge for the Vnc 30 plus £150-worth of software from Audiogonic's catalogue. Total value of his prizes: £280.

He was also given a preview of some of the new software due next issue. At the presentation to Francis were Paul Laporte, of *Home Computing Weekly*, Mr Smith and Susan Allan, of Audiogonic, and Jeremy Bagg and Fran McMillan, of Audiogonic's public relations consultants.

Games with a longer life

People deserve more than run-of-the-mill Space Invader games — that's what Jubberwocky Software thinks.

Its first program, *From Russia With Luck*, took Jubberwocky's team five eight months to write. The game is an adventure based on reliable information — its database includes information from Thomas Cook's *Contables* and the *ABC World Almanac Guide*.

The aim of the game is to travel from Russia to Italy, trying to cut short and out-manoeuvre the KGB as you go.

According to Chris Smith of Jubberwocky, "It has arcade action, but you need to use skill and judgement too."

Jubberwocky's next offering will be *Apex*, "an adventure game with a difference" for the BBC micro.

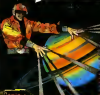

Another game is "waiting for clearance from a higher authority", according to Chris Smith. "It's something to do with the LAP", he said.

But he emphasised, "we won't be making games on the market. We believe in quality games, and those take time to write."

Jubberwocky Software, 870 Washford Marsh Road, Birmingham B6 3NQ

Send your letter to Letters, Home Computing Weekly, 145 Charing Cross Road, London WC2H 0EE. Don't forget to name your computer — the best letter could win £5 worth of software. Queries cannot be answered on this page

Spectrum's key illusion

Have you ever noticed the full size photograph on the front page of *Spectrum* and if you look carefully at the keyhole in the photograph, you will notice that the keys seem to be covered in shiny hard plastic, whereas on the second page of the ad the keys appear as their normal rubbery selves.

Taking a closer look at the photo on the first page, you can see that the picture has been heavily touched up. I believe this to be breaking the *Sale of Goods Act 1979* (quote: "Where goods are sold by description, there is an implied condition that the goods will correspond with the description" (section 11).

If a photo isn't a description, what is?

W. J. Bailey, Watford, Herts

Bill Neill, for Sinclair Research, and "All that has been mentioned in that photo is the real keyhole on the keys, which doesn't appreciate well photographically — but then it's just because we thought people would want to be able to read them. Apart from that, there's been no actual contact with the 'keyhole' having had a few brushes with the Advertising Standards Authority lately, we're being super-careful now."

Rallying round

Recently I bought a copy of your magazine (June 1982) and opted on the rally program for the VIC-20. The game would not run properly until the following changes were made:

- 18 PRINT "HOME,COL,C1, (del)+SHIFT" out of line 1000
- 50 IF FEEL(3)=100 OR FEEL(3)=1000 GOTO 1100

Apart from this, the game ran well. I hope that your magazine will say as good as it is. Good luck for the future.
Norman Fowler, Woodford, Essex

Can you take the PAICC(sic)?

Formative by Priestel and desperately short of dollars, the Priests' wife of Cornwall now has an up and running computer with

PAICC (Priests' Area Independent Computer Club) hopes to change all that. The Club is non-profit making, non-aligned, and aimed at both the professional and amateur user. Its goal is to promote computer literacy in the area and to stimulate the use of computers in local education.

The PAICC Freeland Committee includes a representative for women, for local industry, for education, for business applications, for home users and for under 16s.

The Club is an informal meeting every Friday at a well-equipped room above the Business Micro Centre, which has allowed the club to store some of their equipment and use it as part of their program.

PAICC is fully affiliated to the ADC and prospective members should phoned on the following: **Neville Erickson Smith on 0476 74841, Paul Whitbread on Penrose 6803 or Mrs Millage on 0476 585. Simon Erickson Smith, Hayle, Cornwall**

Anyone for an Oric club?

Does anyone in West Lothian, Scotland, own an Oric? I am hoping, with the idea of starting an Oric club for the area, with a view to organising meetings like swapping tape etc.

I've got a few ideas of my own as to how a club should be run, but I'm open to suggestions. If you are interested in starting/joining a group of users in the West Lothian area, ring me on **Whitburn 4301.**

Stuart Wilson, Whitburn, West Lothian

Where's my game?

Due to the response I had early on, I was hoping to get a copy of the game, but I've not heard from you yet. I bought an Atari 400 and, being on limited means, looked around for some cheap games.

I saw an ad for Cascade Software's 50 Games for £8.95, and sent off my postal order 13 weeks ago. Seven weeks later,

they sent me a letter promising delivery within 14 days, and since then, nothing!

I have written asking for either the tape or a refund, but have had no reply. What's going on?

R. Davies, Bolton, Lancs
Mr Stevens, of Cascade, said: "We had some quality control problems with the 50 Games tape, and a lot of the early tapes we sent out were defective. Now we're frantically trying to get a batch that's up to standard, and when we do they'll be depleted as soon as possible."

Oric critic unrepentant

I think I must write to defend myself from C. Black and Mark Phillips (issues 14 and 15). They both seem to accuse my letter, but my letter was after all based on my own experience with the Oric.

Having recommended the Oric to a friend, I felt guilty when he finally had to take it back, and supposed that I had been so wrong in assuming its potential. I really felt that on the basis of both the advice and reviews that it was cracked up to be better than should be.

I suppose I failed to be plastic in my first letter that the Oric's reviewers on the whole failed to do their usually very good job. For once they all said that they had never made that weren't working properly. How could they review a machine that wasn't fully operational?

Now a few specific points. As Mark Phillips says, the Oric does indeed have system checking — once you have entered the whole program and run it. Most larger machines work like this, I know, but it is really a good idea in a machine aimed at the beginner.

C. Black from Glasgow only seems to have had contact with the Oric, as indeed I've had from because of the possible sound effects on the Spectrum. Admittedly it is easier to produce good sound on the Oric, but as it was designed as a successor, with three sound channels, it certainly should be.

To paraphrase Mr Black, one final point: you may get what you pay for, but price is subjective. The 40K Oric and Spectrum were both originally priced the same, and it's only good business practice to understate your expectations if you can.

John Miles, London N4

TALKING WITH AN INTERVIEWER ABOUT YOUR RESUME

Gobbledegook Jupiter Ace plus 16K £7.95

Jupiter Controls, Chesham
Building, Bourne Street, Chesham
Ches 122

If you feel a sense of déjà vu on running this superbly-named piece of electronic simulation it will not be in any way surprising, for there is a mine full of dots, a mobile monster-eat them, phone — sorry, gopher! — to watch the gophers! — to eat the monks and powerpunks which give off roughly seven seconds at which to eat a gopher. Sounds familiar?

There are two levels of difficulty and the score instructions

tell you that when eaten by a gopher you "lose" one of your three lives. The program keeps your at present score and tempts you to try to better it.

The game is very fast and will use the skill of even the experienced arcade addict, who will also presumably feel at home with the continuous score reminder which accompanies it.

A relatively expensive version of this kind of game with very critical volume level on loading.

★ ★ ★

Spectrapede 48K Spectrum £5.95

Frank, High Street, South
Queensferry, Edinburgh EH6 6NR

In this attractively-presented game, you defend your mainframe gate by firing with a gun controlled by the same button.

The main target is a centipede which moves down the screen and yields a score when hit but also breaks into two separate insects.

Attacked by spaceons, spiders, worms and flies add variety and the loss of three

lives terminates each game.

There are three degrees of difficulty and several players may compete by entering their initials so that their scores are shown on a score sheet display.

While hardly unique, the graphics and action of this game are very good and the levels of difficulty about right both for the beginner and for others with more skill and precision. Most well liked Spectrapede very good fun and many will become addicted.

Hopper VIC-20 £5.99

Edible, 120 Seaton Road,
Hurry Hill, 105

OK, it's a hopper game, how could you tell?

Many years ago I had a Haemon I, which was a lovely computer. My favourite game for this machine (apart from the only one I paid) was called Ladybug Ladybug and it was a very good game. I was very good at it and I was very good at it.

Now I can enjoy those days with this excellent game. It is graphically well done, and has a very satisfying

User defined graphics are used in a most constructive fashion and the lady bug is a really fellow, rather than bugs that I have seen.

Take a stroll down the arcade

How do you choose from all the
arcade clones on the market?
Well, you could start by reading
our reviews...

Road Toad Spectrum £4.95

Atkinson, Unit 2, Shire Hall In-
dustrial Estate, Sutton Walden,
Essex

Another version of the well known Frogger, in which you endeavour to cross a road across busy road, a busy stream, motorcars, then a river full of turtles and logs, to reach the safety of a safe pond.

You must, of course, avoid the wheels of the trucks and the snout of the crocodiles and, when you reach the river, you must cross by riding on the backs of the turtles and logs so as not to fall in.

There is no underhand way

to do this when you fall in the river in this game, but I suppose it's possible to pass.

Very colourfully graphed with detailed high resolution, and particularly liked the movement of the logs.

However, the use of sound effects could have been improved. Only one short sound is used in the entire program and the keyboard clacking shows people who only are like in a letter, preventing diagonal hopping. This reduces the element of skill involved.

Munch-Man 48K Spectrum £4.50

Amco Software, 28 Spenny
Lane, Tonon, North Hants

We another in the long line of Pac-Man games and in this, Amco have produced a good representation.

You have three lives to play with and 10 levels of difficulty from 1000 to 9000. After 3000 points you are awarded another life. This is not as easy as it sounds as these ghosts seem to be intelligent enough to trap you from being rewarded too often.

The only criticism is that you never see the ghost boys and this does make the action a bit flat.

Despite this, it is a very good game for those who are addicted to this type of game and with the high score facility, it is good for two or more. R.B.

Kiltdale

At Kiltdale we don't treat computer program duplication as a side line. We are the specialists.

Since we started three years ago we have developed a dedicated data duplication service that is second to none.

We developed specialist machinery and installed it in a clean air environment. Coupled this with our tape, specially formulated for data. Add rigorous quality control and our product and service speak for themselves. No job is too large or too small. So if you are looking for data cassette duplication why don't you tell us?

The REMarkable REM

There's more to REM statements than meets the eye — here Ray Elder explains how they can be used to store data

A few weeks ago I wrote about strings and the Sinclair computer. I suggested that they could be used to store data, but although that is perfectly valid, it does use a lot of memory.

Don't forget that memory (RAM) is used to store the BASIC lines, and when RUN, a copy of the string is made in the VARIABLES section of memory. Therefore a string of, say, 100 characters takes over 200 bytes of memory.

There is a way of storing data which uses only one area of memory. So do that we must make use of the two commands which cause the printer to return to the beginning in computing: FEED and POKE. To use these effectively we must, of course, know a little about the way a computer works.

The computer's memory is usually compared to a filing cabinet with each drawer numbered. We can look in any drawer (FEED) or put a number into certain drawers (POKE). The numbers we can enter from the ZX include for each drawer. The first drawer is 0, followed by 1, 2, 3 up to the end of the memory.

In the ZX81 the first 8192 drawers (bytes) are filled with instructions to the machine. These are read-only memory, and we can look at them by FEEDING but we cannot change them. The next 8192 bytes are unused. The Spectrum ROM, however, uses all the first 16384 bytes.

The next bit is our RAM memory that we can change at will. However, the first five bytes are used to hold special information for use by the computer as it works. These have to be in RAM as they are constantly changed and updated — and you can't change ROM memory. If we wish

we can change some of these to our variables, but if you don't know exactly what you are doing you could really confuse your machine.

Finally we come to the bytes which store our BASIC program. The first two bytes contain the first line number, followed by two bytes which give the number of bytes used by the line — not for each character code plus one for the "end of the line" or dollar.

Let's look at that in detail. Here's the program:

```
10 REM ABCDE
20 FOR I=1000 TO 16384
30 PRINT " " - "": POKE I
40 NEXT I
```

Change line 20 to POKE I = 23760 TO 23760 for the Spectrum. ROM and 23760 are the first addresses (byte is "drawers") of our user RAM on the ZX81 and Spectrum. RUN this program.

Note, the second number is the line number. The third number is the length of line. The fifth, number 124, is the code number for REM. Now match the codes for the remaining numbers, using the list given at the back of your manual.

We can change these if we want by FORKING in different values — but after each command TRY POKE 16384 for the ZX81, or POKE 23760 for the Spectrum, or any of the addresses 16384-16512 (ZX81), 23760-23764 (Spectrum) with various numbers.

If you want to confuse your machine POKE any of the numbers I have not mentioned — (LINE length, END of LINE marker) with a different value.

REM, of course, marks for REMark and the computer, on finding one of them, ignores the following bytes, therefore whatever we put after a REM is not going to affect the computer's operation.

The most commonplace usage for this (apart from genuine remarks!) is to store a machine-code program. Here are some examples, for the ZX81 and the Spectrum. In all the following programs, when two lines with the same number are given, the two lines approximate to your machine.

Program 1
1 REM (Program does ZX81 thing three dots Spectrum)

```
20 FOR I = 16384 TO 16512
30 REM
40 FOR I = 23760 TO 23764
50 INPUT A
60 POKE I,A
70 NEXT I
```

Run this program and enter the following numbers, one at a time, pressing newline for entry after each one.

ZX81: 14, 21, 42, 12, 64, 4, 32, 55, 124, 198, 124, 119, 14, 249, 10, 11, 32, 249, 261

Spectrum: 11, 0, 99, 1, 192, 2, 124, 15, 15, 124, 7, 67, 124, 7, 7, 7, 230, 35, 55, 124, 234, 192, 124, 101, 119, 15, 11, 120, 177, 32, 230, 261

Now enter program 2 — replacing your old lines — do not use REM for lines less than 1 (which, you will notice, now contains the characters whose codes are the numbers you entered).

```
Program 2
10 FOR I = 1 TO 15
20 PRINT AT INT (ROW*PI), INT (ROW*PI), " " (PI=inverse space) (ZX81)
30 PRINT AT INT (ROW*PI), INT (ROW*PI), INR INT (ROW*PI), PAPER INT (ROW*PI), "X" (Spectrum)
40 NEXT I
40 RAND USR 16384 (ZX81)
40 RAND USR USR 23760 (Spectrum)
```

Seventy-five characters are printed on screen and then (line 40) the background and foreground is exchanged — a screen invert. On the Spectrum the INR and PAPER values for each of the attributes are exchanged. This can be a useful effect in your programs!

And so, at last, to our DATA storing system. Ideally we want a way of storing a number of varying length words (or

3X PROGRAMMING

numbers, as efficiently as possible.

My solution (no doubt there are others, equally as good) is to prefix each data item with a byte which contains the length of the complete item, then when receiving an item, use the "length" bytes to jump over unwanted data.

First of all make your list. To demonstrate I will use Monday, Tuesday, Wednesday as I first count the number of words. Now count the total number of letters and add the two numbers.

Then is the number of days you will require in your REM — for my “days of the week” data I need $7 \times 50 = 37$ days after I REM (you add an extra 33 bytes for a routine which I’ll explain later). Now a program to PLACE each name was above.

1998

```

10 LET X = 10000 (25000)
20 LET X = 25000 (Spectrum)
30 INPUT AS
40 IF AS = "Y" THEN STOP
50 LET AS = CHR$(LEN
  AS + 1) + AS
60 FOR I = 1 TO LEN AS
  PRINT I, X, CHR$(AS(I))

```

```

40 LET X = X + 1
70 PRINT X
90 GOTO 30

```

Roll in and enter your data one row at a time, pressing **ENTER** (or **ENTER**) after each row. Enter 5 in row

To remove an item, insert (M) and the following number, rather as a part of a program or as a subprogram (if it is to be used often).

100

```

10 LET X = 10000 (START)
10 LET X = 27700 (Spectrum)
10 IF N = 1 THEN GOTO 45
20 FOR I = 1 TO N
30 LET X = X + PEAK X
40 NEXT I
45 LET DS = ""
50 FOR I = X + 1 TO X +
    PEAK X - 1
60 LET DS = DS +
    CHR(PEAK I)
70 NEXT I
80 PRINT DS

```

(Program 4 uses 170 bytes of program, memory plus the variables set up, but, mind-bogglingly, it uses more than 100,000 bytes of space than has in a loop.)

and it takes a noticeable time to retrieve your data. So, as a final flourish, here is a machine code program to retrieve your data automatically. All on 32 machine code bytes after 45 BASIC bytes!

All the rest of the `REMI` I had to add an extra 35 bytes — that's what they are for. The only difference between these routines is the location of the `REMI` and variable addresses. `REMI` is to give, substitute the numbers in brackets () for the locations.

It is essential that the first line of your program depart from the REMQ as well as the REMQ. AS though a target data item. Everying to my example of weblogs, I will want:

1. **CHINA PERIOD**
 1949-1979 = 1949 + 1979-1949
 = 19 + 19 COLUMNS

IN FORM 1 - JUNE - 19-12

```

30 INPUT A
30 POKE 1A
40 NEXT I

```

N is the total number of words plus the total number of letters (37 in my example) + one, work one and note the start address: $33124 + 36 + 1 = 33161$.

© 2004 Blackwell Publishing Ltd, *Journal of Internal Medicine* 255: 105–112

Now run the program and enter these numbers one at a time as before. Once entered, S-A-V-E your program — if you've made one error, you'll lose the lot!

8, 1, 33, 130, 4000, 64, 502, 175,
184, 402, 4, 22, 494, 25, 16,
232, 78, 13, 123, 31, 4, 6, 277,
99, 10, 171, 64, 502, 109, 16,
713, 237, 176, 78, 201

To use the random **POKE** the database — 0 to the start address + 1 and call it by **LET DS = DS** (to USA start address). For example, to pick a random weekday from my database:

```

DO LET A = INT (RNDPT * I)
DO FOR I=1, A - 1 (2000,
  Repeat=1)

```

IN: LIFT 105 - 105 (TO USA)
UNCLASSIFIED: Restricted

PRINTING

I have deliberately used lengthy and expanded program lines to make the working of the system more obvious. Don't hesitate to modify, adapt and improve to suit your own requirements. These are simply ideas for you to use if, and when,

Take on your TI

Looking for a TI game? Our reviewers look at a selection for TI BASIC and Extended BASIC

Hong Glider Pilot £13 Extended BASIC

By Maple Leaf Music Warr, from Starline Software, 10 Alcorn Road, Stockport, Cheshire SK6 1AB

If you have ever floated away from a steep cliff aboard a hot air balloon, then without the added thrill of breaking a leg or two, here this Hong Glider is made for you.

The object of the game, for one or two players, is to pump from a ridge and glide for the greatest distance and time before

landing safely in a designated landing zone. More difficult in practice than theory, a minimal score of around 90 per cent indicates (I hope) that the transfer is more difficult than the real thing.

You are presented with a graph displaying of your position on the landscape together with 'realistic' readings covering such factors as height, orientation, wind speed and direction. Considered different from the display indicate the position of terrain which you fly.

Devil Craze £12 Extended BASIC

By Maple Leaf Music Warr, from Starline Software, 10 Alcorn Road, Stockport, Cheshire SK6 1AB

Your unlikely sounding boss for this game are the Cray And Devil. The Great Impactor and The Fine Big Bad Boz.

Three rules govern the game of quick reflexes and decision making. Rule one — if the enemy has colour matches the left direction I on the keyboard, if the colour has a match on the right, press R. Rule two — if you are

death appear, do the opposite and finally rule three — identify the great impactor.

Confused? Upon completion you are rated according to your score, descriptions ranging from "Crazed Whizz" to "Crazed Master".

At £12, plus an Extended BASIC cartridge, this might prove a little expensive for people. Good graphics and sound, superb presentation. Slime shows the

★★★★

Cut-Off £5

Starline Software, 10 Alcorn Road, Stockport, Cheshire SK6 1AB

This is a fun game where one of two people can play on the standard machine or faster with the extended BASIC using keyboard or joystick.

The object of the game is to survive. As you go along you have to avoid buses and your own or opponents truck. As fast as possible are viable but as the game progresses they become invulnerable. Further on, a bus and truck come into play and the bus can be avoided.

You gain points for truck

and passing through flashing power signs. You have 11 lives as the game has a reasonable length of time.

Unlike usually the game is round. Trucks along with the power squares, which makes it hard on your eyes, and although the available obstacles can be somewhat annoying when you pass through flashing squares they aren't avoided when you crash with them.

★★★★

Spillage £5

Starline Software, 10 Alcorn Road, Stockport, Cheshire SK6 1AB

Considered Gulf of Spillage, if you think this is a full 11. Because the game was ready to play. I lost time and the game was over. My second game was brought to an abrupt end by a 'bad subscript' error.

On subsequent attempts I managed to cross the path, displaying 10 years of obstacles which started from side to side. My tank can crash twice after every two

coral crossing in some of the obstacles explained leaving it clear. Whether this is part of the program or an error I cannot say. At the end of the game the score is high enough, it started in a 'score table' and the player is asked to play again.

The graphics are far from a better choice of colour would make the player to see the gas in some. Really. The over-use of sound shows the game down. This is not a worthwhile — 23-40

★★★★

Tickworld £9

By Matt Polytechnic, from Starline Software, 10 Alcorn Road, Stockport, Cheshire SK6 1AB

Tickworld takes place in a space jungle inhabited by eight multi-eyed and hairy ticks. They can crawl in small holes, under the end of the arrow keys on the keyboard, attempting to both avoid and capture mid morning snack and to capture the right ticks with the use of an unlimited supply of anti-snack tape.

The only way to capture these nightmare monsters is to shut them out and hope they stumble into one of two traps

deliberately towards you. Luckily their brains are not as good as their sense of smell.

There are three skill levels to choose from, the only apparent difference being two stars on ticks earned on the higher levels.

Graphics and sound of ticks were quite impressive, adding much to the playability of the game.

My only criticism was the slow speed of the game and the extreme difficulty in getting a tick out again. Overwhelming odds.

Mazes make the game . . . here's how to construct them

For some reason, which psychologists can probably explain, the maze is one of the consistent devices used in computer games.

The use of graphics to generate a 3D maze is of particular value since the player actually experiences the sensation of being lost in a labyrinth.

Early programs achieved this by using the standard character set to draw the maze. While the effects produced by this approach are reasonable, the method is limited in creative time and thinking.

Since most home computers now have high resolution, most interesting effects can be achieved. The article describes an algorithm for displaying 3D mazes using high resolution graphics. The program is reasonably machine independent, and it will generate enough detail to not be convoluted.

The first way of describing a maze is to divide it into square cells, each allocated a value depending on which sides are walls and which are passages.

If each side is considered to be one bit of the cell value, a value of 1 will represent a wall and a value of 0 a passage.

Figure 1 shows the north-facing wall bit, 1, and counting clockwise, the cell values are focused as shown in Figure 3. A cell with one wall on the west side will have a bit pattern of 0000 (zero), a cell value of 0 (zero). Figure 3 shows a maze again up into cells.

By using a simple key, it is possible to examine the cell value to establish which directions are possible. The secret is to give each direction a value (west=1, north=2, east=3, south=4) and apply the corresponding bit in the cell value.

The expression in line 360 of listing 1 performs this test and returns a 1 if you face a wall or 0 if you face a passage.

Consequently, moving simply involves changing direction as required, turning the way you face and moving to the next cell. Lines 2019 to 2140 do exactly that.

In order to avoid cluttering up the screen with programs, appropriate comments are placed via a CMT statement.

I have deliberately restricted the behavior of the program to minimal movement. You may only move from

Writing your own 3D maze game? Allen Webb's detailed advice will help you design mazes to lose yourself in

one cell to the next by repeating F for forward, L (left), R (right) and B (backward) simply change the direction you face.

In order of this memory, the cell details are stored in two blocks of RAM and accessed by PEELING and POOLING. The first block of RAM starts at location 100, (see lines 90 and 70) and holds the cell values described earlier.

The second block starts at location 100, (see lines 90 and 70) and holds the "cell attributes". These attributes contain a flag which is used in the maze routine, but they can also be used to indicate if the room contains anything else. For example, FPA and FPR control the storage and access of the cell data and use the x,y coordinates of the given cell.

Most of the routine handles the actual graphics commands and logic, the main problem being the accuracy of drawing a passage of several cells using the maximum number of graphics routines.

The maximum number of lines views is 5 (see Figure 4) and these views are drawn by some routines accessed by line 30000. In order to get a good perspective effect, the view of each cell is drawn smaller as the cell gets farther away.

This is achieved by use of two scaling factors, DM and PY and the position of the cell relative to the player position, (RP). The constants in line 180 (currently 1.3 and 4) can be altered to suit the aspect ratio of your screen.

The number of cells shown that you can see is set in line 90 as NC. Lines 240-240 examine each cell in sequence in your line of sight and draw the view of each cell.

This is compound and the required number of cells has been drawn, or until a blank wall is encountered. The algorithm in Figure 1 gives the details of the method used.

The routine was developed on a VIC-30 with a Super Expander, but I have tried, wherever possible, to avoid using machine dependent commands.

You will see from listing 1 that the main conversion work involves the drawing routines. Line 90 sets up the resolution limits of the graphics (X1,X2,Y1,Y2), set these to your own values. The graphics

PROGRAMMING

commands used have the following syntax:

DETERM 3. $(X_1, Y_1) \sim (X_2, Y_2)$
 means a test from $(X_1, Y_1) \sim (X_2, Y_2)$

IDEALW 2 TO AC2.Y1 shows a
line from the current point
to AC2.Y1.

The number following the word **CHAR** specifies the colour of the line, or 2 draws the line in the character colour. 0 uses the screen colour.

POINT 2, X_2, Y_2 sets the enclosed area with colour

Several of the statements use Boolean functions. In Core Modulo computers that return a value of -1 and false a value of 0. If your machine uses different values then you should change these lines: 180, 308, 3543, 3690, 2180, 2180 accordingly.

Lines 2150-2169, 2200-2225, 2250, 2280-2291 are simple ways of performing multiple IF statements and should be changed in a similar way. Line 220 states post-mortem heading is the top of the screen.

Variable 80 in line 70 allows for the silly scaling system used by the paper compiler. Set it to one for other machines.

I mentioned earlier that two areas of RAM are required for data storage. The RAM must be predivided from compilation and will depend on your machine. If you are using a mass of X cells made by Y cells high, you will need to reserve $X \cdot Y$ bytes for each storage area. Line 10 shows that for the YG. Ignore this line for other machines.

The action of `lsort` is starting at line 40000 will give a map of the mass if `M` is input at the move stage. This routine uses the attribute array to draw the required portion of the mass (attribute = 0). The uncolored region (attribute = 129) is shown.

Only a 20 by 16 array of cells is drawn, so if your screen is larger than this, only a portion of it will be displayed. Lines 40000-40010 crop results smaller than the display area.

Just \$800-\$9000, decide which portion of the menu is drawn such that you get the best view from your current position. The logic is not designed to decide long thin states with one dimension less than the

Take \$25.00 with you for your trip
get a key before returning to
the office.

Basically there are two approaches to designing the menu. The choice depends on the type of establishment.

First, you can have a fixed mass, up to 10-50 megagrams; the mass in Figure 3. The system is acceptable provided the mass is big enough, say 10 or 100, to make exploration difficult.

As such, this approach is ideal for dragons and dragons-type individuals. The main drawback is that the design of such a system is very time consuming.

The alternative is to use a program to design a random maze. Listing 3 is such a program. If you provide the program with the dimensions of the maze and the storage address (QA) it will create and save the maze. Any commands in square brackets represent cursor control commands for formatting the display. TAB is the internal escape command.

The routine has not been expanded and is therefore rather slow (a 30 by 30 maze will take about 30 minutes). Perhaps one of you readers can come up with a better routine.

Lastly, I have been designed deliberately to provide most of the experience. The most obvious area of use would be an adventure type scenario in which the graphics are used to draw objects, monsters, items, etc.

It is a simple matter to use simple drawing routines with scaling factors to draw objects which appear in the diagrams and give inputs as you approach them. A coloured isochrome makes a positive as

The structure makes it the best way of allowing for oblique etc. But 7 is already used for the map routine, but the other bits leave you with 127 above all subroutines, eg let 1 set = get in ground, let 2 set = drugstore.

I have presented what I hope is a visualist stage program which can be adapted for your institution.

The actual memory used up by the system is not excessive and owners with 128- or more memory should be able to avoid it weighing into trouble. Really it's all down to the manufacturer.

PROGRAMMING

1. The first step is to identify the problem. This involves understanding the symptoms and the context in which they are occurring.

2. Next, you need to gather information. This can be done through interviews, observations, and reviewing relevant documents.

3. Once you have gathered the information, you need to analyze it. This involves looking for patterns, trends, and potential causes.

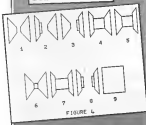

4. After analysis, you should develop a plan of action. This plan should outline the steps you will take to address the problem.

5. Finally, you need to implement the plan and monitor the results. This involves putting the plan into action and tracking progress over time.

Price wars — the makers strike back

It appears that vendors are going to go into the large market for low cost home and personal computers over here. Just recently, both Radio Shack and Wally's are now at Tandy and Times/Simcity have announced new machines.

Radio Shack has debuted the model T8600 APC 16 which retails at \$179.95. It's fairly in line with other. It comes with 4K, 16 K RAM expandable to 32K. It's one of a plug-in module (available later in the year). The machine is capable of producing eight colors for graphics.

Although there is no software immediately available (this is expected), the firm has indicated that eventually new programs that may run on a 4K Radio Shack Color Computer will run on the new machine with few modifications.

The new machine looks a lot like the Times/Simcity 2000 Spectrum to suit with an small pad type which have graphics symbols and letters on them, and possibly BASIC functions changed in various letters. The APC 16 comes with a novel port allowing the user to address modules and printers, and with a cassette input/output port.

★ ★ ★ ★

Earlier than just now, but with a brand new machine, Tandy has also spent to upgrade its model T13 2000 color computer — an improvement from home — by expanding its display. It will now display 64 columns and 24 lines as well as 32 by 24.

The new machine is called the T13 2000. It is priced at the middle of the line and is said to be compatible with the lower priced 2K 2000 (2A05) in the UK. It is a month or two away from the market. It is to be targeted at the educational market. When it becomes available next month, it will cost less than \$200.

A closer with 16K RAM, it is expandable to 32K via an optional T13 16K memory module. Having a small pad keyboard with 40 keys, it can produce 32 graphics (which are not in additional 32 normal characters). Although the feature, the 2000 is it supposedly completely compatible with all hardware and software available for the 2000.

It is interesting to observe the details of the on-going price wars among the low cost computer manufacturers. Tandy, which continued greatly to the cost of the war, was basically forced to reduce two of its machines in order to compete.

In January of the Wally's Computer Electronic Show at Las Vegas, a debut two models of the 2000, one with 16K RAM and the other with 4K. These machines were to be marketed at \$149.95 and \$199.95.

Now, they have been replaced by machines coming with 16K and 4K of RAM, while still being offered at the price announced in January. To take advantage of the January discount and to speed up applications programs, the 2000 now has built-in memory.

When it becomes available "next month", the 2000 will be factory supported by no less than 40 software packages. Right now, the company offers over 100 packages for the 2000 which supposedly can also run on the new T13. The cartridges scheduled for the 2000 should be out around August and cost between \$15 and \$30.

I wonder who will start the next war? When the manufacturers have gotten all the money they can out of lowering the cost, I suppose the next war will be over who can offer the most features without raising the cost of the computer. Tandy let you know what happens.

Bob Lee
Fairfield, California

Jackpot VIC-20 £5.50

Mt Chip, 1 Neville Place, Llan-
staden, LL30 2SL.

This program offers a rather good simulation of a three machine. You are presented with a steady list and display of a four red from machine showing a well designed fruit symbols.

When you press F7 the odds reset in a highly realistic manner. The simulation comes with the full range of options such as bet, nudge and gamble.

The nudge option offers a variable number of nudges and you can nudge to either direction of spin the roll of your chance.

Each spin/reel is accompanied with different sound effects or music. You start with ten pounds to spend.

Overall jackpot is a beautifully written simulation giving superb graphics, animation and use of colour. In fact, this program makes Commodore's fruit machine cartridge look unbelievably cheap and naive.

Monte Carlo Spectrum £4.95

Microimage, 210-214 Lavender
Hill, London SW11 1LE.

Two games on one cassette sounds like great value... and it is! Here, Microimage presents two casino games, Blackjack and Craps.

Your Spectrum plays for the House in both cases but is kind enough to let you win at least once at the time. The screen display is attractive and features colour itself aims for the ever defined graphics. It really like the hand that rolls the dice! You

could also learn a thing or two from the way in which the programs are written.

The games themselves are straightforward. Blackjack is a form of pinball and Craps is purely betting on the fall of the dice. But sometimes, even though the idea is simple, unexpected, and if you're a gambler, the program holds its own.

Challenge Poker TI-99/4A £7

Development, from Quantum/Soft-
ware, 16 Almonds Road,
Stockport, Cheshire SK6 1AM.

Challenge Poker is something of a crisis between Poker and Bingo, but don't let that put you off. It is an enjoyable and challenging game for all TI-99/4A owners.

For all four players, the game is a complete standard five card poker hands along the river, community or deep-pot of a five by five square (approximately), the computer taking responsibility for a "wild card". Twenty-four cards are dealt at random by the com-

puter and played by each player in turn, on their board. From six normal playing cards, six normal playing cards from 1 point for two pairs to 9 points for a straight flush. The game continues until any player has 100 points. I was particularly pleased with the good colour graphics of the game.

One noticeable drawback, however, is that only one player's board is displayed at a time, the being redrawn for each player. This becomes slow and tedious with more than two players.

Program encounters of the Forth kind

Jupiter Cantab is so sure that Forth beats BASIC that it made a computer, the Jupiter Ace, and a range of software, specially for it. But can it make its mark in a world of Basic programs? Steven Vickers talked to Candice Goodwin about the case for Forth

These days, anyone who launches a home computer that, like the Jupiter Ace, has a black and white display and doesn't use BASIC has to be either very out of touch with the home market, or pretty sure of what they're doing.

You couldn't really accuse Jupiter Cantab's founders of being out of touch. Both Steven Vickers and Richard Alexander worked for Sinclair, and Steven wrote most of the firmware (BASIC-based software) for the Spectrum.

Despite the fact that both the ZX81 and the Spectrum turned out to be market leaders, Steven and Richard weren't satisfied with working for Sinclair. "We felt that running computer companies should be the hands of engineers, not entrepreneurs", said Steven.

One of their major projects was the programming language, BASIC, used by both the ZX machines and all the other popular home machines. Steven says of BASIC, "it's not the language that beginners should start on, you can't write long programs in it easily".

When they came across Forth, Richard and Steven felt they'd found the answer. "It had enough structure for long programs and it ran very quickly. We saw it as a way of getting people free from the bonds of BASIC imposed on them".

Forth was first developed in 1971 by an American, Charles

Morris, who wanted a language that would control radio telescopes easily. He really wanted to call the language Forth, for 'fourth generation language', but he was working on an IBM computer which only allowed him five letters for a file name.

Forth programming is based around the concept of a spring of words, each word defining an action to be carried out by the computer. You start off with a series of the words already built into the computer — the equivalent of the GOTOs, PRINTs and so on in BASIC — and then define new words in terms of a sequence of old ones. Each word, then, is roughly equivalent in a reference.

Forth runs faster than BASIC because after the program has been written, each of the key words is converted to a two-byte address, ready for the computer to execute immediately. In BASIC, however, the computer has to do most of the operations to 'help' the program to actually running.

Steven and Richard decided that the best way to give Forth to a wider audience was to design a computer specially for it. Richard has been putting components together for a while, and he had a working prototype by the end of 1981.

But because they were both busy getting the final touches to the Spectrum, they didn't make

the break with Sinclair until spring 1982.

There was no Richard's home in Bar Hill, just outside Cambridge, where they worked first in an upstairs room and then, when Richard's son was born, and the room was turned into his nursery, in the garage. "Richard's wife gave birth at practically the same time as the computer was born", Steven recalls.

The son was having the first version of the Jupiter Ace ready by September 1982. By working 12 hours a day, they did it. But in the meantime, of the friends, there wasn't much of focus for the new machine.

The need to write some software forced Richard and Steven to look more carefully at who would be using the Ace. They started off with a general idea that it would be "a machine that would access structured and powerful programs". So they didn't add colons like a colour display and a full alphanumeric keyboard. But Steven now feels that "we haven't devoted all of those possibly enough".

Top-confuse the issue, the Ace's first collection of programs included a number of snake and space games. But Steven says, "we shouldn't be pushing it in the games market. I find computer games addictive, but not in a good sense. By the end of the game, I wish I hadn't bothered. It's time computers did something useful".

So now Jupiter Cantab is concentrating on programs for the educational and business markets. They've already had orders from research labs, universities, and politicians,

and from several schools who are using it to control experiments like the Cyber robot from Cyber Robotics. But the company's now working on word-processing and physics programs to boost the Ace's educational appeal.

As for the business market, could the Ace, without small ordinary keys and so low profile, really catch on? Steven admits that they are "working on the case to make it more acceptable to business", and a desktop model can be expected in a few months' time. But he estimates that "the possible applications for things like spreadsheets are quite powerful".

Jupiter Cantab now has a new base and a slightly different line-up. It recently moved from Richard's house into Cambridge itself, in 180-year-old premises in Chesters Building, Brunton Street. Richard has now resigned as a director, in order to spend more time with his family, and his brother Steven has replaced him on the board. There's also a marketing director, Geoffrey Walker.

The ace itself is selling steadily, and Jupiter Cantab's commitment to it is evident in plans to bring out products to support it — a 16K RAM expansion already appeared, and a greater one is due out in a few months.

But for Jupiter, the Ace isn't just any old computer. As Geoffrey Walker put it, "Forth programming is interesting. It's what you really wanted to do with a microcomputer".

Or as Steven Vickers said, "Comparing Forth to BASIC is like comparing a Gothic cathedral to a mud hut".

Steven Vickers and Richard Alexander: two hot Forth

Introduction

One thing's certain about the Sinclair world - there's never a dull moment!

Every month sees new software and new hardware - produced by Sinclair enthusiasts, or produced by Sinclair itself.

The magazines do a fantastic job of keeping you up to date with the input of enthusiasts. We want to keep you in touch with Sinclair's own developments.

Every month, there'll be a Sinclair Special in this magazine.

Sometimes, inevitably, there won't be anything new to say - we want to break away from the breathless announcements of hardware and software you just can't buy.

But when something new is available, we want you to have accurate information - fast! You'll find it here.

This month, we're giving you the latest information on the recommended retail prices of Sinclair equipment! They're our prices, and you may well find things cheaper (or dearer) in the shops. If they're cheaper - terrific! Snap them up. Note, however, that from us the ZX81 is down to £99.95.

We're also announcing six superb new Sinclair cassettes for the Spectrum, and three more which make full use of the ZX81. There's an order form at the back of this Special.

Next month's - but these next month is another story! Watch (as they say) this space.

Nigel Searle

ZX81 now £39.95

Six new ways to make more of your Spectrum.

Take a look at these brand new titles. Each is an outstanding new program using the full potential of the Spectrum, for games with stunningly animated graphics, for strategies of ferocious cunning, for masterly applications of computing capability.

Cyrus Is Chess Based on the Cyrus Program which won the 2nd European Microcomputer Chess Championship and trounced the previously unbeaten Oxy Bits machine. With 8 playing levels, castles piece movement, rook and take-back facilities, plus two player option. The 48K version has many additional features including an extensive library of chess openings. For 16K or 48K RAM Spectrum.

Horace and the Spiders Make your trip with Horace to the House of Spiders armed only with a limited supply of anti-spider-bite venus. In the house, destroy the webs before the spiders can repair them. Then destroy the spiders, before they destroy Horace! Undoubtedly the creepiest Horace program ever produced! For 16K or 48K RAM Spectrum.

Computer Scrabble The famous board game, on screen - with the whole board on view! A huge vocabulary of over 11,000 words. Puzzle letter files, four skill levels - the highest of which is virtually unscalable. For 1 to 6 players. For 48K RAM Spectrum.
© 1985 Oxy Bits. All rights reserved. No part of this document may be reproduced without the written permission of Oxy Bits.

Backgammon A fast, exciting program with traditional board display, rolling dice and doubling cube. Four skill levels. For experts - or beginners. (Rules are included - it's the quickest way to learn the game.) For 16K or 48K RAM Spectrum.

FORTH Learn a new programming language, as simple as BASIC, but with the speed of machine code. Complete with Editor and User manual. For 48K RAM Spectrum.

Small Business Accounts Spreads and simplifies accounting work, produces Balance Sheets, Profit and Loss information and VAT returns. Complete with User manual. For 48K RAM Spectrum.

Overleaf - your Sinclair order form.

Three new ways to get the best out of your ZX81.

The range of Sinclair software for the ZX81 continues to grow.

These three new titles offer two totally different challenges to you and your ZX81. The games—like so many ZX81 games today—really do use the ZX81's capability. The FORTH program is a fascinating extension of your own computer understanding.

Sabotage Defender or a Hacker? The choice is yours in this exciting game.

Be the Guard and defend the randomly placed bases of ammunition inside the compound—or be the Saboteur and attack the ammunition!

Written by Microplan for a ZX81 with 16K RAM. Cassette price: £4.95.

City Patrol You see the Commander of a liner firing ship. Your task is to intercept and destroy alien outside ships descending on your city. Judge your reflexes—Commander by how many aliens you destroy and how much of your city survives.

Written by Microplan for a ZX81 with 16K RAM. Cassette price: £4.95.

FORTH Discover a new programming language which combines the simplicity of BASIC with the speed of machine code.

FORTH's compiled code occupies less than a quarter of the equivalent BASIC program and runs ten times as fast. It is fully extendable by the addition of user-defined commands.

Free User Manual and Editor Manual with each cassette.

Written by Anic for a ZX81 with 16K RAM. Cassette price: £14.95.

How to order

Simply fill in the relevant section(s) on the order form below. Note that there is no postage or packing payable on Section B. Please allow 28 days for delivery. Orders may be sent FREEPOST (no stamp required). Credit-card holders may order by phone, calling 01-393 0200, 24 hours a day. 14-day money-back option.

Old wine in new bottles

Some traditional games convert well to computers — others don't. Find out which...

3D Quadrocube Spectrum £4.95

Artic, 396 Jarvis Road, Art, Bick, N. Hantside HU8 8LA

3D Quadrocube is described by Artic as a new version of 10-Tic Tac Toe and Connect Four.

The screen shows a large 3D cube composed of 64 smaller cubes. You and your opponent (either the Spectrum or another player) take turns in repositioning a small cube in your own colour with the object of making a con-

tinuous row, column or diagonal of four.

The large cube is filled with four versions for clarity and the game is easy to play through not so easy to beat the Spectrum.

A pleasant and challenging game.

value for money 90%

★ ★ ★

Othello Jupiter Ace + 16K £7.95

Jupiter Arcade, Kingston Street, Cambridge CB2 1LZ

A French version of the popular game played on a rather much larger by eight squares, against either the Spectrum or a fellow human.

Very user-friendly, the program lets you make any moves without checking and teaches you the rules by trial and error, if you found the rules on the manual card less than adequate.

You always play white (human) the computer is black, and

you will find it a really tough opponent.

There's no special advantage in playing the game on a Fast machine, as speed hardly means anything, and every advantage would just be a distraction.

Playing Othello on the small display, however, does tend to result in a spectrum. A larger display of the same board would be a big improvement.

★ ★ ★ ★

Monopole Commodore 64 £5.99

Artic, 396 Jarvis Road, Bick, N. Hantside HU8 8LA

One of the advantages of a large amount of memory is that very long programs can be developed (given time) to games. This package, an implementation of the classic Monopoly, is such a game, and a very impressive one.

Every feature of the popular board game is reproduced in a colourful and imaginative version which takes all the time, but none of the enjoyment out of

playing.

Complete records of all dice throws are available for recall, and a lot of options for buying, selling, mortgaging and building is provided. The board itself is a complete Monopoly board drawn out on the screen in full colour, with dice thrown, counters moved and cards taken successfully.

Sound and graphics are used sparingly, with occasional flashing icons, a mouse and an alarming police siren, which hardly goes over the top.

Even optional rules such as the Auction rule and Free Parking Jackpot are covered for the

only way to make the complete for all 64 screens, and will easily fit on a 100-screen floppy. Unfortunately only two players can play at a time.

Although written in BASIC, the game does not suffer from a lack of speed, and the graphics are quite good. The program is a very good example of a game which is a must.

★ ★ ★ ★ ★

Decathlon TI-99/4A £7

Providence, from Simulations Software, 10 Albion Road, Southampton, Crowthorne 884 1411

Decathlon features ten Olympic events including, among others, 100 metres sprint, long jump, 100 metre hurdles and pole vault. One-to-eight players take part.

For each of the ten events the players arrange to place a bet at a preset rate following a race — one round for even number one and round for even number two up to ten seconds for even number ten. The player the bet goes in to the preset time, the higher the points scored.

Some of the events, long jump, shot put, discus and

jump, shot put, discus and javelin are on a basis of three or seven times. A simple graphical display is given showing your performance in each event.

The game was amazing for the first computer version, but the enthusiasm quickly dried — and all of the series of ten board games with your own personal insurance. The idea for the game is a good one but it really is down to your performance and that of all other participants.

MAIL ORDER PROTECTION SCHEME

If you order goods from Mail Order Advertisers in this
 magazine and pay by post in advance of delivery, this
 publication will consider you for compensation if the
 advertiser should become insolvent or bankrupt,
 provided

- 1 You have not received the goods or had your money
 returned; and
- 2 You write to the publisher of this publication explain-
 ing the position not earlier than 28 days from the day
 you sent your order and not later than 28 days from
 that day

Please do not wait until the last moment to inform us.
 When you write, we will tell you how to make your claim
 and what evidence of payment is required

We guarantee to meet claims from readers made in
 accordance with the above procedure as soon as
 possible after the advertiser has been declared bankrupt
 or insolvent to a limit of £1,000 per annum for any one
 advertiser so affected and up to £5,000 a year for all
 individual advertisers. Claims may be paid for higher
 amounts, or when the above procedures have not been
 complied with at the discretion of the publication, but
 we do not guarantee to do so in view of the need to set
 some limit to the commitment and to learn quickly of
 reader's difficulties

The guarantee covers only advance payment sent in
 direct response to an advertisement in this magazine
 (not, for example, payments made in response to cate-
 logues etc. received as a result of answering such
 advertisements)

CLASSIFIED ADVERTISEMENTS ARE EXCLUDED

FOR FIRST TIME USERS...

A new series of books which introduces newcomers to the most widely used macros in the marketplace.

The books assume absolutely no knowledge about computers and the reader is shown even the most fundamental operations such as "switching on" and "loading a program". The books lead the reader through simple programming and then onto graphics, with several programs which show how to achieve pictures and even animations. The books contain a number of specially written programs which show the full potential of these machines.

"The text is liberally supported by all manner of useful diagrams and illustrations (including many black and white photographs of the screen). The overall presentation is excellent. The printing, setting out and layouts are clear and positively invite the reader to have a go."

ELIMINATE FAULTY CASSETTES

DataClone is the first company in the UK established specifically for the duplication of data cassettes.

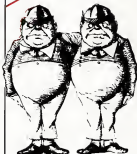

All other duplicating houses are audio orientated — only DataClone has a duplicating system designed to catch purely to handle computer data.

The result? Greatly improved reliability in data transfer rates from 40 to beyond 240 baud — previously unachievable.

All formats covered for. Quantities from 100 to infinity.

Contact us now for brochure.

DataClone — the first specialist service for computer cassettes.
